# Open source software in quantum computing

Mark Fingerhuth, Tomas Babej, Peter Wittek

Mark Fingerhuth

Head of R&D - Co-Founder

Mark is one of the first applied quantum programmers. His published thesis was on [implementing the first quantum machine learning algorithm on superconducting gate-based quantum computers](#).

Tomas Babej

CTO - Co-Founder

Tomas has a double MSc degree in computer science, with focus on [machine learning, cybersecurity and quantum computing](#). Before cofounding ProteinQure, he mastered the art of software engineering at Red Hat.

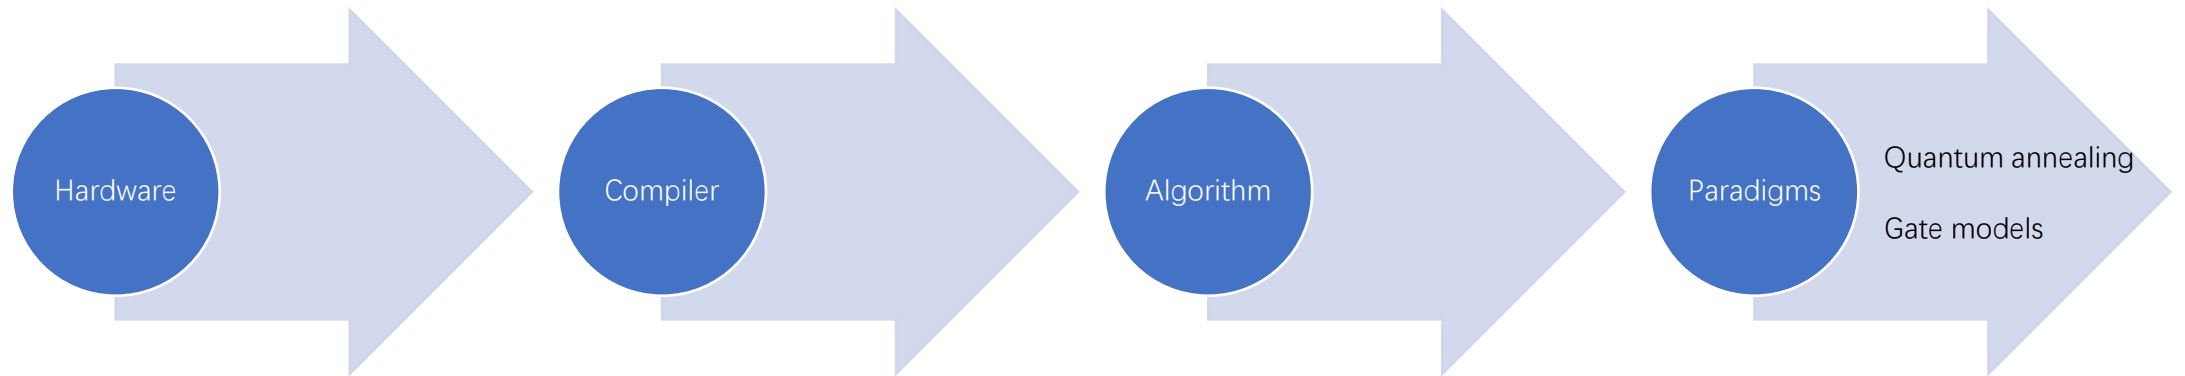

Peter Wittek

Assistant Professor in the University of Toronto working on quantum-enhanced machine learning and applications of high-performance learning algorithms in quantum physics.

Cofounder of the Quantum Open Source Foundation

# The main thing/idea for this article :

1. review a wide range of open source software for quantum computing

*“covering all stages of the quantum toolchain”*

2. evaluation of each project

# Why open source in quantum computing?

## **Reproducibility**

a core tenet of science

## **Impact and publicity**

crucial for both scientific and commercial endeavors

## **Building a community and ecosystem**

steep learning curve that needs to be overcome, therefore it is in the best interest of quantum hardware companies to get more developers involved

## **Gaining credit and increasing human capital**

# Software projects in quantum computing

## **Discrete variable gate-model quantum computing**

- ✓ bits are replaced by qubits
- ✓ logical transformations by a finite set of unitary gates
- ✓ Most popular in hardware

## **Continuous variable gate-model quantum computing**

- ✓ qubits are replaced by qumodes
- ✓ closer to the physics way of thinking, e.g. in quantum optics
- ✓ Most popular language in describing circuits

## **Adiabatic quantum computation**

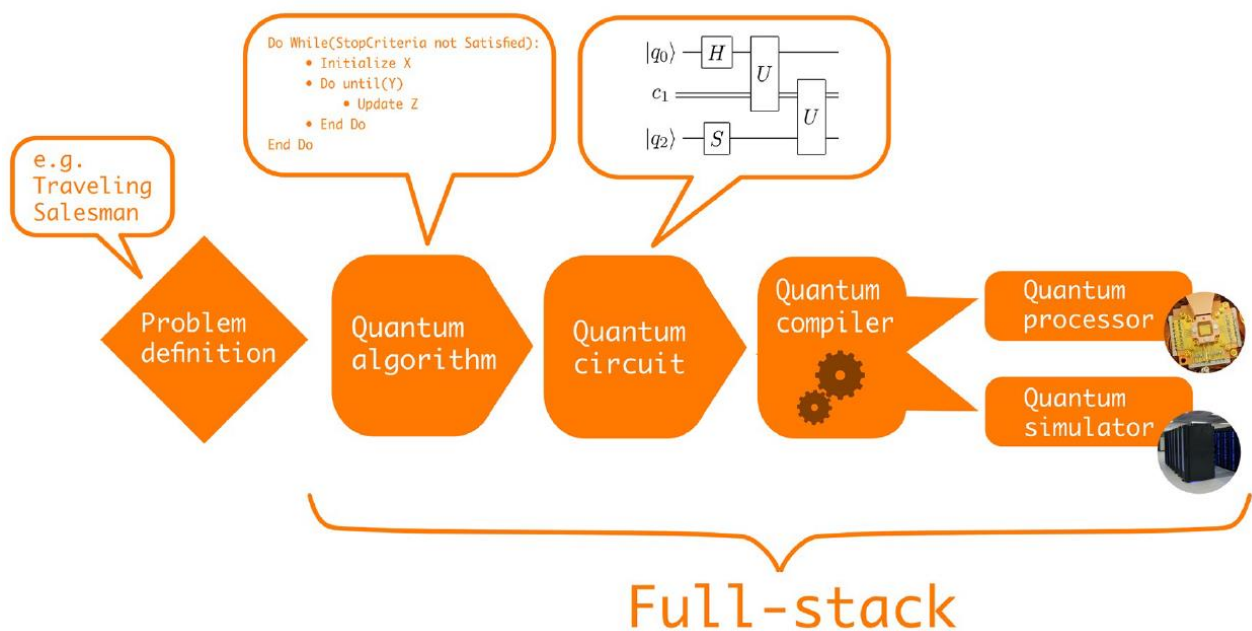

- ✓ Quantum annealing devices
- ✓ Only for some understanding of statistical physics

## **Quantum simulators**

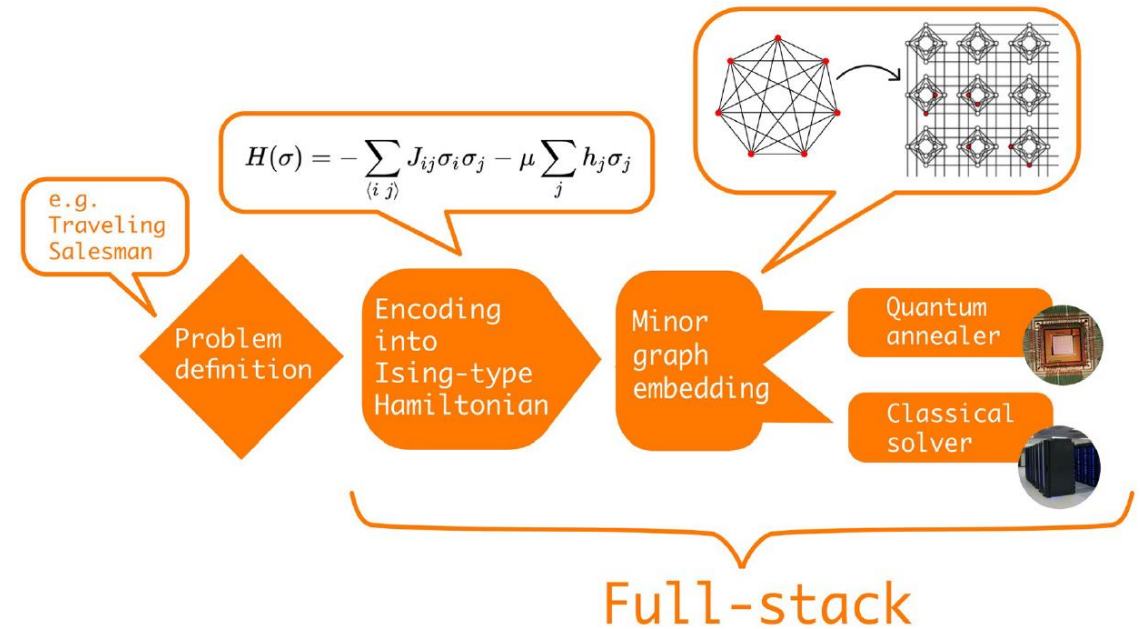

- ✓ Original motivation behind quantum computing
- ✓ Application-specific

# Visualization of a typical quantum algorithm workflow

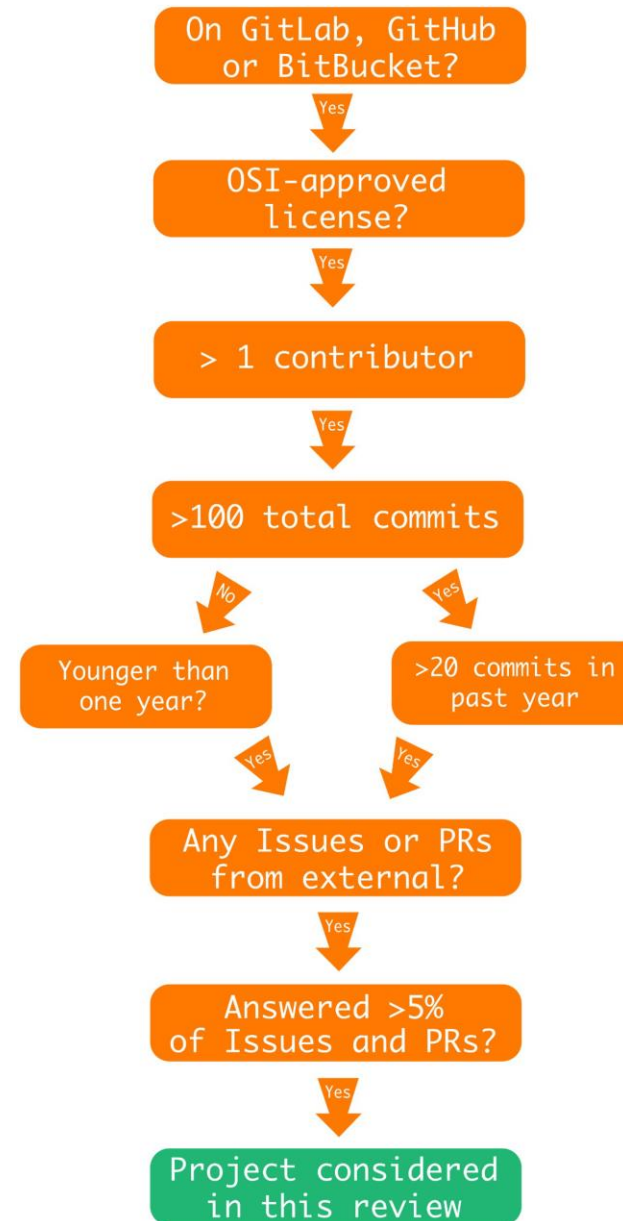

On a gate-model quantum computer:

On a quantum annealer:

# Their standard for considering/evaluating open source Quantum Computing software:

# Projects considered:

Qiskit

Name	Tagline	Programming language	Licence	Supported OS
Cirq	Framework for creating, editing, and invoking Noisy Intermediate Scale Quantum (NISQ) circuits.	Python	Apache-2.0	Windows, Mac, Linux
Cliffords.jl	Efficient calculation of Clifford circuits in Julia.	Julia	MIT	Windows, Mac, Linux
dimod	Shared API for Ising/quadratic unconstrained binary optimization samplers.	Python	Apache-2.0	Windows, Linux, Mac
dwave-system	Basic API for easily incorporating the D-Wave system as a sampler in the D-Wave Ocean software stack.	Python	Apache-2.0	Linux, Mac
FermiLib	Open source software for analyzing fermionic quantum simulation algorithms.	Python	Apache-2.0	Windows, Mac, Linux
Forest (pyQuil & Grove)	Simple yet powerful toolkit for writing hybrid quantum-classical programs.	Python	Apache-2.0	Windows, Mac, Linux
OpenFermion	The electronic structure package for quantum computers.	Python	Apache-2.0	Windows, Mac, Linux
ProjectQ	An open source software framework for quantum computing.	Python, C++	Apache-2.0	Windows, Mac, Linux
PyZX	Python library for quantum circuit rewriting and optimisation using the ZX-calculus.	Python	GPL-3.0	Windows, Mac, Linux
QGL.jl	A performance orientated QGL compiler.	Julia	Apache-2.0	Windows, Mac, Linux
Qbsolv	Decomposing solver that finds a minimum value of a large quadratic unconstrained binary optimization problem by splitting it into pieces.	C	Apache-2.0	Windows, Linux, Mac
Qiskit Terra & Aqua	Quantum Information Science Kit for writing experiments, programs, and applications.	Python, C++	Apache-2.0	Windows, Mac, Linux
Qiskit Tutorials	A collection of Jupyter notebooks using Qiskit.	Python	Apache-2.0	Windows, Mac, Linux
Qiskit.js	Quantum Information Science Kit for JavaScript.	JavaScript	Apache-2.0	Windows, Mac, Linux
Qrack	Comprehensive, GPU accelerated framework for developing universal virtual quantum processors.	C++	GPL-3.0	Linux, Mac
Quantum Fog	Python tools for analyzing both classical and quantum Bayesian networks.	Python	BSD-3-Clause	Windows, Mac, Linux
Quantum++	A modern C++11 quantum computing library.	C++, Python	MIT	Windows, Mac, Linux
Qubiter	Python tools for reading, writing, compiling, simulating quantum computer circuits.	Python, C++	BSD-3-Clause	Windows, Mac, Linux
Quirk	Drag-and-drop quantum circuit simulator for your browser to explore and understand small quantum circuits.	JavaScript	Apache-2.0	Windows, Mac, Linux
reference-qvm	A reference implementation for a Quantum Virtual Machine in Python.	Python	Apache-2.0	Windows, Mac, Linux
ScaffCC	Compilation, analysis and optimization framework for the Scaffold quantum programming language.	C++, Objective C, LLVM	BSD-2-Clause	Linux, Mac
Strawberry Fields	Full-stack library for designing, simulating, and optimizing continuous variable quantum optical circuits.	Python	Apache-2.0	Windows, Mac, Linux
XACC	eXtreme-scale Accelerator programming framework.	C++	Eclipse PL-1.0	Windows, Mac, Linux
XACC VQE	Variational quantum eigensolver built on XACC for distributed, and shared memory systems.	C++	BSD-3-Clause	Windows, Mac, Linux

# Why Qiskit “split”?

## Qiskit API documentation

Qiskit is an open-source framework for working with quantum computers at the level of circuits, pulses, and algorithms.

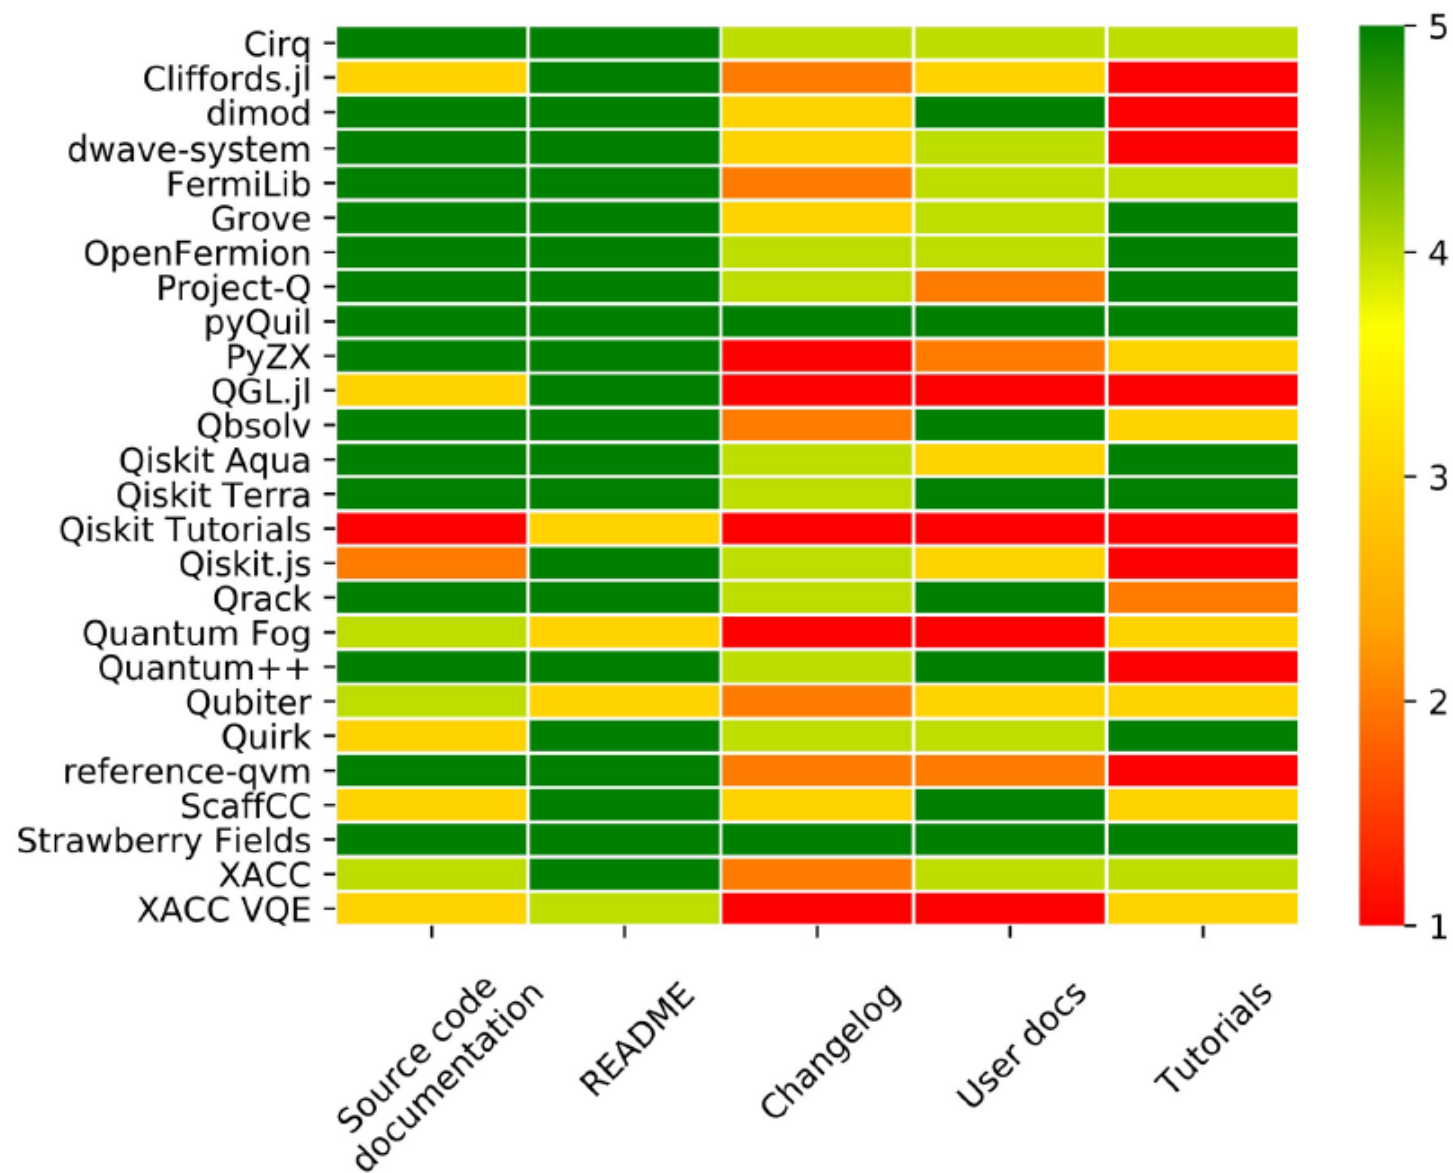

A central goal of Qiskit is to build a software stack that makes it easy for anyone to use quantum computers. However, Qiskit also aims to facilitate research on the most important open issues facing quantum computation today.

You can use Qiskit to easily design experiments and run them on simulators and real quantum computers.

Qiskit consists of four foundational elements:

- [Qiskit Terra](#): Composing quantum programs at the level of circuits and pulses with the code foundation.
- [Qiskit Aer](#): Accelerating development via simulators, emulators, and debuggers
- [Qiskit Ignis](#): Addressing noise and errors
- [Qiskit Aqua](#): Building algorithms and applications

## Conclusions :

These open source projects lowers the barrier to learn quantum computing  
*It reflects the same process that happened in machine learning*

Lack of standardization in the field  
*Multiple players develop competing software platforms*

Lack of stand-alone quantum compilers  
*Most compilers are either proprietary, closed-source or absorbed into quantum full-stack libraries*

# The usage of Qiskit

## The easiest way :

1. Search “anaconda python”
2. Download the Python3.7 version
3. Install it via “sh Anaconda3-2019.10-Linux-x86\_64.sh”
  - a. 可修改默认安装目录
  - b. 建议安装完后允许其自动shell配置
  - c. 同时“conda config --set auto\_activate\_base false”避免自动环境激活
4. “conda create -n qiskit-py37 python=3.7”
5. “conda activate qiskit-py37”
6. “pip install qiskit”

includes: **qiskit** **qiskit\_terra** **qiskit\_aer** **qiskit-ibmq-provider** **qiskit\_ignis** **qiskit\_aqua**  
marshmallow [scipy](#) networkx jsonschema [numpy](#) psutil sympy ply nest\_asyncio  
websockets cvxopt Quandl fastdtw docplex scikit\_learn h5py [pyscf](#) dlx six  
decorator attrs importlib\_metadata pyrsistent mpmath urllib3 idna chardet  
cryptography ntlm\_auth python\_dateutil pyasn1 ndg\_httpsclient inflection  
pyOpenSSL pandas more\_itertools doccloud joblib zipp cffi pytz pycparse

# The usage of Qiskit

**Additional packages are suggested :**

(especially when you follow the tutorials in YouTube of Qiskit)

(in the “qiskit-py37” environments)

1. “conda install jupyter matplotlib”
2. “jupyter notebook”

# <https://quantum-computing.ibm.com> (Overview)

The screenshot shows the IBM Q Experience dashboard. The browser's address bar displays `https://quantum-computing.ibm.com`. The page content includes:

- Welcome yingjin ma**: A personalized welcome message.
- Your providers**: A section showing the user's personal profile with 15 / 15 credits and a "See more" link. A red circle with the number 3 highlights this area.
- New here? Get started with the IBM Q Experience!**: A central banner with an illustration of two people and two main options: "Circuit Composer" and "Qiskit Notebooks".
- Your backends (8)**: A list of quantum systems with their qubit counts and job queues. A red circle with the number 2 highlights this list. The backends shown are:
  - ibmq\_16\_melbourne (14 qubits) - Queue: 9 jobs
  - ibmq\_essex (5 qubits) - Queue: 2 jobs
  - ibmq\_burlington (5 qubits) - Queue: 10 jobs
  - ibmq\_london (5 qubits) - Queue: 25 jobs
  - ibmq\_vigo (5 qubits)
- Account Menu**: A dropdown menu in the top right corner showing the user is signed in as "yingjin ma" and providing options for "My Account", "Close Tabs", and "Logout". A red circle with the number 1 highlights this menu.
- Activity Bar**: A vertical sidebar on the left with various application icons. A red circle with the number 4 highlights the "Home" icon.

# Quantum "Hello World!" program via Qiskit (remote server)

The screenshot displays the IBM Q Experience dashboard in a Firefox browser window. The main interface shows a welcome message for 'yingjin ma' and a list of providers with access to the 'ibm-q/open/main' namespace. Two provider cards are highlighted with orange circles and arrows:

- ibmq\_16\_melbourne v1.0.0**: 14 qubits, online since Nov 06, 2018. Error rates: Single-qubit U2 error rate (1.229e-3 to 1.548e-2), CNOT error rate (2.917e-2 to 1.949e-1).
- ibmq\_essex v1.0.1**: 5 qubits, online since Sep 13, 2019. Error rates: Single-qubit U2 error rate (4.152e-4 to 7.586e-4), CNOT error rate (1.096e-2 to 1.532e-2).

The dashboard also shows a list of other providers: ibmq\_burlington (5 qubits), ibmq\_london (5 qubits), and ibmq\_vigo (5 qubits). The interface includes a sidebar with application icons, a top navigation bar, and a main content area with a 'Welcome' message and a 'Getting Started' link.

# Quantum “Hello World!” program via Qiskit (jobs status)

The screenshot shows the IBM Q Experience dashboard in a Firefox browser. The page is titled "IBM Q Experience - Dashboard - Mozilla Firefox" and the URL is "https://quantum-computing.ibm.com". The dashboard features a navigation bar with "Getting Started ..." and a main content area with two primary sections: "Circuit Composer" and "Qiskit Notebooks".

On the right side, there is a sidebar displaying the status of various quantum backends. Each backend is listed with its name, number of qubits, and current queue size. The backends shown are:

- ibmq\_essex (5 qubits) - Queue: 3 jobs
- ibmq\_burlington (5 qubits) - Queue: 3 jobs
- ibmq\_london (5 qubits) - Queue: 22 jobs
- ibmq\_vigo (5 qubits) - Queue: 6 jobs
- ibmq\_ourense (5 qubits) - Queue: 65 jobs
- ibmq\_5\_yorktown - ibmqx2 (5 qubits)

In the center of the dashboard, there is a section for "Pending results (0)" with the message "You have no experiment runs in the queue." Below this is a section for "Latest results (2)" which contains a table of completed runs. The table has columns for Status, Provider, Service, Run date, Name, and Id. Two rows are visible, both with a status of "COMPLETED".

Status	Provider	Service	Run date	Name	Id
COMPLETED	ibm-q/open/main	Backend: ibmq_essex	an hour ago		5de753ddecfb80019dfc44a
COMPLETED	ibm-q/open/main	Backend: ibmq_essex	2 days ago		5de5063d8023440011fa8228

Two blue hand-drawn circles highlight the "Pending results (0)" section and the "Latest results (2)" table.
